

DETECTING GENETIC PREDISPOSITION
TO SIGHT-THREATENING DIABETIC RETINOPATHY
ABSTRACT OF THE DISCLOSURE

5

A method and kit for predicting increased risk of sight-threatening diabetic retinopathy which includes isolating genomic DNA from a sample from a diabetic patient. The genetic polymorphism pattern for the genes IL-1A, IL-1B and IL-1RN is then identified in the DNA. The identified pattern is compared with control

10 patterns of known polymorphisms, and patients expressing a genetic polymorphism pattern associated with increased risk of sight-threatening diabetic retinopathy are identified.
